Section Title(S): Terms Applied To Affines

The terms applied by the latter method are the generational terms, the *tsu-//ga* and *!gun!a*—or *tūn!ga* w.s.—*tūn* pairs. The affinal terms *n!unba* or *n!untai* would probably be added except when the terms were applied to young persons and children. The sibling terms are not applied to secondary affines unless the homonymous method is in use and requires them. The terms *!gun!a* and *tūn* are applied to the persons with whom ego may joke, *tsu* and *//ga* to persons with whom he avoids joking.

601
Kinship Terminology

I had difficulty at this point in clarifying the statements of my informants as to the pattern of the application of the terms. Actually, informants applied terms to their secondary affines on the basis of names, not by the generational method, and it was hard for them to figure out what term they would use if they were not to use the one they do use. They are not accustomed to working things out theoretically, and I, in my attempt to do so, misconstrued what was told me, applied the wrong principle, and constructed a diagram that was wrong (namely, Diagram 8 on p. 17 of my article as originally published in *Africa*). I wish to express my thanks to Ward Goodenough for his careful study of the diagram and for his kindly calling my attention to an inconsistency in reciprocation within it. An inconsistency is a signal of error; the !Kung system has no inconsistencies.

601
Kinship Terminology

My misunderstanding lay in the matter of alternation of joking by generations. I thought informants were telling me that there *must* be that alternation, that if ego applied *tsu* or *//ga* to a secondary affine and did not joke with that person, it would follow that he would apply the *!gun!a-tūn* terms to that person's offspring and joke with them. But this proved to be a mistake. The

Kin Relationships

system does not work that way. Ego may avoid joking in both the generation of the parent and the offspring.

Further study of my notes and more careful thought lead me now to believe—in fact, make it seem obvious—that the consistent and proper pattern of applying terms to secondary affines is essentially the same pattern that we see applied to primary affines, which in turn is analogous to the pattern of joking among consanguineous kin. All secondary affines in his parents' generation ego would term *tsu-n!unba* and *//ga-n!untai*. He would apply these same terms to all in his offspring's generation, probably omitting the *n!unba* or *n!untai* part of the term. Among secondary affines who are the siblings of primary affines, the primary affine is the point of reference. With the sibling of his primary affine who is the same sex as the primary affine, ego would maintain the same joking status (be it joking or not joking) that he maintains with his primary  222 affine. He would take the opposite position with the primary affine's sibling whose sex is the opposite of that of the primary affine. Thus, for example, a male ego would joke with his BrWiSi since he jokes with his BrWi, and he would refrain from joking with his BrWiBr. Since the sibling terms *!go*, *!kwi*, and *tsi* are not used in these relationships, the term applied by a male ego to BrWiSi would be *tūn-n!untai*, to BrWiBr *tsu-n!unba*. A female ego would avoid joking with BrWiSi since she does not joke with BrWi, and to her BrWiSi she would apply the term *//ga-n!untai*; she would take the opposite position with BrWiBr, whom she would term *!gun!a-* (or *tūn!ga-*) *n!unba*.
